

Skillet 0.0.6 — your personal skill library

12 September 2026 · Product brief · Supersedes the broad roadmap in 0.0.5.

Skillet gives you a clean, personal view of the skills you choose to use: what they do, which projects and agents can use them, when they are invoked, and how to share them.

Your installed and selected skills are the starting point. Search means searching your library. Adding a skill means choosing a folder or importing something you deliberately selected. A public marketplace, community rankings and team publishing are outside this product's current scope.

The four things it must do well

Action	What you get
Make global	Promote a project skill into your top-level Global library and make it available to the agents you select. Preview the move and links; preserve existing project access where intended.
Change invocation	Edit what the skill should be used for and the supported agent-specific controls for automatic use, explicit invocation or disabling. See which linked copies will be affected.
Share a skill	Download the complete skill folder as a versioned ZIP, including its referenced scripts and resources. Send it through Slack or another file-sharing tool. The recipient chooses where to install it.
Copy to another agent	Choose an agent and global/project destination. Make an independent copy or keep one shared linked copy. Explain incompatible settings and missing tools before applying.

Global storage and agent availability are separate: putting a skill in Skillet's hub must not imply that every agent automatically reads it. Similarly, copying files from Codex to Claude Code must not imply that vendor-specific settings have been converted correctly.

The everyday view

Open Skillet → see your skills → filter by Global, project or agent → click a card to read/use the skill → edit invocation or use the corner share control.

Keep these existing capabilities available without crowding each card: duplicate detection, file differences, availability explanations, local history, undo, trash/restore and worktree awareness. Put detailed paths and filesystem plans inside the relevant detail or review step.

The main view should answer: “Which of my skills do I want here?” and “Will this agent be able to use it?”

Your design decisions

- **Light only. Skillet uses soft yellow.** The shared library also offers pink, peach red, blue and purple through consistent semantic tokens.
- **Solid pastel buttons; subtle gradients in backgrounds only.** Apply this to page, card and modal surfaces.
- **Clean clickable cards.** No View button. A separate share icon sits at the top right. Reusable chips show agent, scope and category.
- **Compact controls.** Copy is an icon beside the prompt; close and share use familiar icons with accessible names and tooltips. Keep labels where the action needs explanation.
- **+ New Folder.** Adds an existing folder to Skillet's project scan.
- **Rounded, compact, aligned modals.** Brief copy, grouped fields, a clear main action, visible focus and useful error feedback.
- **Small inline statuses.** An icon and readable label, without wide outlined status strips.
- **Reusable components live in Components,** outside Skillet and HeartTap. Copy approved implementations into each product so each app remains self-contained.
- **Desktop first.** Mobile redesign is deferred. Preserve earlier design revisions using 0.0.x labels.

What the earlier suggestions meant

These were competitor features, not requirements you had requested. Their presence elsewhere does not make them gaps Skillet must fill.

Term	Plain meaning	Fit for your Skillet
Skill templates	A starter SKILL.md with name, description and instruction sections	Optional convenience if you want to create skills inside Skillet. Not required for managing your chosen collection.
Import scanning	Inspect an incoming skill's instructions and scripts for suspicious behavior	Keep basic validation and a readable file preview with import. A dedicated threat-analysis feature is a separate, optional decision.
Pinned projects	Folders you explicitly mark for quick access	Optional small convenience; not a reason to redesign the product.
Recent projects	Shortcuts to folders recently opened in Skillet	Optional. No need to inspect editor history or rank projects by inferred usage.
Private publishing	A hosted team registry with accounts, permissions and published packages	Out of scope. Sending someone a skill ZIP needs none of this.
Marketplace discovery	Browsing public skills, rankings or community collections	Out of scope for the main experience. You curate what enters your library.

The earlier comparison found public installation/update commands in Vercel Skills, creation and project shortcuts in Skill Manager, and governed team publishing in SkillHub. These tools solve adjacent problems. Skillet does not need their full feature sets.

Two ideas worth retaining for a personal collection are **where a skill came from** and **whether your saved copy has changed**. Skillet already has local instance comparison. A source link or optional update check for a skill you selected could extend that later, without introducing a public catalog or automatic installs.

What is built, and what remains

State	Included
Existing code	Local discovery, project/worktree scanning, card inventory, editor, visibility matrix, global move, local copy/link, history, undo and trash.
Designed or requested; still needs app integration	Yellow shared components, latest card/icon/modal refinements and clearer Global navigation.
New work	Portable ZIP export/import and reliable adaptation of agent-specific invocation settings.
Correctness work identified in 0.0.5	Codex config reader/writer compatibility, agent-specific visibility rules, preserving malformed settings instead of overwriting them, and detecting changes to supporting-file contents.

This is a product brief, not a new application release. The inspected application package is 0.1.0; the current Paper file is 0.0.4. The 0.0.5 audit retains the implementation evidence; its broader feature roadmap is superseded by this brief.

Build order

1. Correct agent availability and invocation handling so the information is trustworthy.
2. Finish your approved personal-library interface using the shared yellow components.
3. Complete ZIP sharing/import and copy-to-agent flows, with file previews, conflict handling and recovery.

Success means you can find a skill you chose, make it available in the right place, control its invocation, and send a working copy to someone else. That is the product to finish before adding optional conveniences.
